
SELECTED PROFILE: PLAN AND PHYSICAL PATH
SCOPED OWNER CONTROL
Neutral plan / immutable source catalog
Semantics, encoding, placement and source identity
Metadata descriptors, not payload or residency ownership
Scope-local owner / journal
Journal before backend submission
Physical resources stay owner-held
Admission / source-bound read-only plan
Exact key + stage requirements + persistent resident bytes
Covered-domain claims before each stage's submission
Logical publication
Authorized output / state
Owner-local in-memory protocol
validated success + preflight
Materialization
Source read
Checkpoint ranges
Host staging
Bounded payloads
Transfer / install
Exact destination
Completion validation
Match operation / key / stage / bytes
Generations + retained fence
Success ≠ known failure
named custody proof only
Execution provider: CUDA instance
Resident weights
Generation binding
Workspace / arena
Temporaries
KV / model state
Pages and pins
Custody / retirement
Owner-held pins, leases and claims
Reuse only after final relevant fences
Consumer owner / model work
Lease-protected bindings and state
Output consumers end at their final relevant fence
Causal traces / observability
Scoped identity and stage metrics
Logical terminal ≠ cleanup proof
Control / plan
Storage
Execution
Publish / retire
Unknown / failure
Scoped boundaries. Solid: plan/resource dependency. Dashed: evidence/owner control.
Covered-domain budgets do not hard-cap OS page caches or storage-server caches.
No durable ACID, global commit, universal registry, or default NCCL/collective route is implied.
